

□ Why You're Not Seeing Your App

Because the WSGI file is correctly importing from main, but your main.py currently contains only this default "Hello from Flask!" app.

Your real app — the one you pasted earlier with file uploads, form processing, and index.html — is either:

Not saved to main.py, or

Saved in a different file (maybe app.py or something_else.py), or

Overwritten or not uploaded to the correct path.

□ What You Should Do Now

□ Option A: Replace main.py With Your Full App Code

Open /home/cloudpos/mysite/main.py

Replace the current contents (the "Hello from Flask" one) with your full app code (the version you pasted earlier that uses render_template, CoverGenerator, etc.)
